FURTHER MATHEMA	ATICS		9231/23
Paper 2			May/June 2018
			3 hours
Candidates answer or	n the Question Paper.		
Additional Materials:	List of Formulae (MF10)		

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** the questions in the space provided. If additional space is required, you should use the lined page at the end of this booklet. The question number(s) must be clearly shown.

Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place in the case of angles in degrees, unless a different level of accuracy is specified in the question.

Where a numerical value is necessary, take the acceleration due to gravity to be 10 m s^{-2} .

The use of a calculator is expected, where appropriate.

Results obtained solely from a graphic calculator, without supporting working or reasoning, will not receive credit.

You are reminded of the need for clear presentation in your answers.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

Sphere *B* continues to move until it collides with a fixed smooth vertical barrier which is perpendicular to the direction of motion of *B*. The coefficient of restitution between *B* and the barrier is $\frac{3}{4}e$. After this collision, the speeds of *A* and *B* are equal.

(ii)	Find the value of e .	[3]

A particle P of mass m is attached to one end of a light inextensible string of length a. The other end of the string is attached to a fixed point O. The particle is held with the string taut and horizontal. It is projected downwards with speed $\sqrt{(12ag)}$. At the lowest point of its motion, P collides directly with a particle Q of mass km which is at rest (see diagram). In the collision, P and Q coalesce. The tension in the string immediately after the collision is half of its value immediately before the collision. Find the possible values of k.

During the summer months, all members of a large swimming club take part in intensive training. The times taken to swim 50 metres at the beginning of the summer and at the end of the summer are recorded for each member of the club. The time taken, in seconds, at the beginning of the summer is denoted by x and the time taken at the end of the summer is denoted by y. For a random sample of 9 members the results are shown in the following table.

Member	A	В	С	D	Е	F	G	Н	I
х	38.5	40.2	32.3	35.1	36.2	41.4	32.0	38.2	38.2
у	37.4	38.1	31.6	34.7	34.2	38.6	31.8	36.3	36.8

The swimming coach believes that, on average, the time taken by a swimmer to swim 50 metres will decrease by more than one second as a result of the intensive training.

(i)	Stating suitable hypotheses and assuming a normal distribution, test the coach's belief at the 10% significance level. [8

11 Answer only **one** of the following two alternatives.

EITHER

An object is formed from a square frame ABCD with a square lamina attached in one corner of the frame. The frame consists of four identical thin rods, each of mass M and length 2a. The lamina has mass kM and edges of length a. It has one vertex at C and adjacent sides in contact with CB and CD (see diagram).

(i)	Show that the moment of inertia of the object about an axis l through A perpendicular to the plane of the object is $\frac{2}{3}Ma^2(7k+20)$. [8]

The object is released from rest with the edge AB horizontal and D vertically above A. The object rotates freely about the fixed axis l. The angular speed of the object is $\frac{1}{2}\sqrt{\left(\frac{5g}{a}\right)}$ when D is first vertically below A.

Find the value of k .	[6

OR

A scientist carries out an experiment to investigate the quantity X, which takes the values 0, 1, 2, 3, 4, 5 or 6. He believes that the values taken by X follow a binomial distribution. He conducts 250 trials. His results are summarised in the following table.

X	0	1	2	3	4	5	6
Observed frequency	22	83	72	53	17	3	0

(i)	respect	that unbiased estimates exively, correct to 3 decimals, explain why X constants.	nal plac	es. By e	evaluati	ng the m
