Paper 2			May/June 2019
			3 hours
Candidates answer of	on the Question Paper.		
Additional Materials:	List of Formulae (MF10)		

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** the questions in the space provided. If additional space is required, you should use the lined page at the end of this booklet. The question number(s) must be clearly shown.

Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place in the case of angles in degrees, unless a different level of accuracy is specified in the question.

Where a numerical value is necessary, take the acceleration due to gravity to be 10 m s^{-2} .

The use of a calculator is expected, where appropriate.

Results obtained solely from a graphic calculator, without supporting working or reasoning, will not receive credit.

You are reminded of the need for clear presentation in your answers.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

IN III Carabuida Assassant

This document consists of 25 printed pages and 3 blank pages.

(iii)	iii) Find the total kinetic energy lost by the three spheres as a result of t	he two collisions. [3]

A uniform rod AB of length 4a and weight W rests with the end A in contact with a rough vertical wall. A light inextensible string of length $\frac{5}{2}a$ has one end attached to the point C on the rod, where $AC = \frac{5}{2}a$. The other end of the string is attached to a point D on the wall, vertically above A. The vertical plane containing the rod AB is perpendicular to the wall. The angle between the rod and the wall is θ , where $\tan \theta = 2$ (see diagram). The end A of the rod is on the point of slipping down the wall and the coefficient of friction between the rod and the wall is μ .

Find, in either order, the tension in the string and the value of μ .	[10]

A thin uniform rod AB has mass kM and length 2a. The end A of the rod is rigidly attached to the surface of a uniform hollow sphere with centre O, mass kM and radius 2a. The end B of the rod is rigidly attached to the circumference of a uniform ring with centre C, mass M and radius a. The points C, B, A, O lie in a straight line. The horizontal axis L passes through the mid-point of the rod and is perpendicular to the rod and in the plane of the ring (see diagram). The object consisting of the rod, the ring and the hollow sphere can rotate freely about L.

(i)	Show that the moment of inertia of the object about L is $\frac{3}{2}(8k+3)Ma^2$.	[6]

•••••	•••••		•••••	•••••	•••••			•••••	•••••

A large number of runners are attending a summer training camp. A random sample of 6 runners is chosen and their times to run 1500 m at the beginning of the camp and at the end of the camp are recorded. Their times, in minutes, are shown in the following table.

Runner	A	В	C	D	E	F
Time at beginning of camp	3.82	3.62	3.55	3.71	3.75	3.92
Time at end of camp	3.72	3.55	3.52	3.68	3.54	3.73

The organiser of the training camp claims that a runner's time will improve by more than 0.05 minutes between the beginning and end of the camp. Assuming that differences in time over the two runs are normally distributed, test at the 10% significance level whether the organiser's claim is justified. [8]

9 A random sample of 50 observations of the continuous random variable X was taken and the values are summarised in the following table.

Interval	$0 \leqslant x < 0.8$	$0.8 \le x < 1.6$	$1.6 \le x < 2.4$	$2.4 \le x < 3.2$	$3.2 \leqslant x < 4$
Observed frequency	18	16	8	6	2

It is required to test the goodness of fit of the distribution with probability density function f given by

$$f(x) = \begin{cases} \frac{3}{16}(4-x)^{\frac{1}{2}} & 0 \le x < 4, \\ 0 & \text{otherwise.} \end{cases}$$

The relevant expected frequencies, correct to 2 decimal places, are given in the following table.

Interval	$0 \leqslant x < 0.8$	0.8 ≤ <i>x</i> < 1.6	$1.6 \le x < 2.4$	$2.4 \le x < 3.2$	$3.2 \leqslant x < 4$
Expected frequency	14.22	12.54	10.59	8.18	4.47

(i)	Show how the expected frequency for $1.6 \le x < 2.4$ is obtained.	[3]

10 The values from a random sample of five pairs (x, y) taken from a bivariate distribution are shown below

x	3	4	4	6	8
y	5	7	q	6	7

The equation of the regression line of x on y is given by $x = \frac{5}{4}y + c$.

(i)	Given that q is an integer, find its value.	[5]

11 Answer only **one** of the following two alternatives.

EITHER

A particle P, of mass m, is able to move in a vertical circle on the smooth inner surface of a sphere with centre O and radius a. Points A and B are on the inner surface of the sphere and AOB is a horizontal diameter. Initially, P is projected vertically downwards with speed $\sqrt{\left(\frac{21}{2}ag\right)}$ from A and begins to move in a vertical circle. At the lowest point of its path, vertically below O, the particle P collides with a stationary particle Q, of mass Am, and rebounds. The speed acquired by Q, as a result of the collision, is just sufficient for it to reach the point B.

(i)	Find the speed of P and the speed of Q immediately after their collision. [7]

In its subsequent motion, P loses contact with the inner surface of the sphere at the point D, where the angle between OD and the upward vertical through O is θ .

Find $\cos \theta$.	[5

OR

A farmer grows two different types of cherries, Type A and Type B. He assumes that the masses of
each type are normally distributed. He chooses a random sample of 8 cherries of Type A. He finds
that the sample mean mass is 15.1 g and that a 95% confidence interval for the population mean mass,
μ g, is $13.5 \le \mu \le 16.7$.
